

Track Switch Configuration

A track switch shares the lower track with your existing solid door. In other words when you pull down the Bug Blocker door there is a switch mechanism similar to a railroad track switch at the top of your door opening, the bottom set of rollers toggles the switch and allows the Bug Blocker door to use the bottom track. Only one door can be closed at a time. The switch track provides an excellent seal. If you have a clearance problem because of pipe bollards this is the solution for you. Rasco Industries' track switch has been in production since 1992 and has an excellent "track record". Manual or can be motorized using an interlock mechanism.
